

6.632 Solution to Problem Set 6

Solution P5.1

(a) Using the notation for TE wave, $p_{12} = 2$.

$$T_{12} = \frac{1}{1 + p_{12}} = \frac{2}{3}$$

$$R_{12} = \frac{1 - p_{12}}{1 + p_{12}} = -\frac{1}{3}$$

Since the wave is incident normally, we could also use TM notation. Then, $p_{01} = 1/2$, $R_{12} = 1/3$, and $T_{12} = 4/3$.

(b)

$$\langle \bar{S}_i \rangle + \langle \bar{S}_r \rangle = \hat{z} \frac{1}{2} \frac{k_1}{\omega \mu_1} (1 - |R|^2)$$

$$\langle \vec{S}_t \rangle = \hat{z} \frac{1}{2} \frac{k_2}{\omega \mu_2} |T|^2$$

Power is conserved since we know from application of the boundary conditions $1 - |R|^2 = p_{12}|T|^2$.

(c)

$$\langle \bar{G}_i \rangle + \langle \bar{G}_r \rangle = \hat{z} \frac{\epsilon_1}{2} \frac{k_1}{\omega} (1 - |R|^2)$$

$$\langle \vec{G}_t \rangle = \hat{z} \frac{\epsilon_2}{2} \frac{k_2}{\omega} |T|^2$$

Momentum is not conserved for the given parameters since $1 - |R|^2 \neq 8|T|^2$.

(d) The radiation pressure of an electromagnetic wave is $p = \frac{1}{2} \epsilon |E|^2$. Therefore the pressure on the half space is

$$\bar{F} = \bar{p}_i - \bar{p}_r - \bar{p}_t = \hat{z} \frac{1}{2} [\epsilon_1(1 + |R|^2) - \epsilon_2|T|^2] = -\hat{z} \frac{\epsilon_0}{3}$$

(e) The half space moves toward the incident wave.

Solution P5.2

(a) $\nabla \times \bar{H} = -i\omega \bar{D} = -i\omega(\epsilon_0 \bar{E} + \bar{P})$ Therefore, we may isolate the contribution from the material as $\nabla \times \bar{H} + i\omega \epsilon_0 \bar{E} = -i\omega \bar{P} \equiv \bar{J}_e$

(b) $\bar{J}_b = -i\omega(\epsilon_R - \epsilon_0)\bar{E}$

(c)

$$\bar{H} = \frac{1}{\omega \mu} \bar{k} \times \bar{E} = \hat{y} \frac{k_R + ik_I}{\omega \mu_0} E_0 e^{k_I z} e^{ik_R z}$$

(d) $\langle \bar{f}_b \rangle = -\hat{z} \frac{1}{2} k_I (\epsilon_R - \epsilon_0) |E|^2$, where $|E|^2 = |E_0|^2 e^{2k_I z}$.

(e) $\langle \bar{f}_c \rangle = \hat{z} \frac{1}{2} k_R \epsilon_I |E|^2 = -\hat{z} \frac{1}{2} \frac{n}{c} \text{Re}\{\nabla \cdot \bar{S}\}$ since Poynting's theorem tells us that $\omega \epsilon_I |E|^2 = -\text{Re}\{\nabla \cdot \bar{S}\}$.

Solution P5.3

(a) $\theta_c = 60^\circ$.

- (b) The Brewster angle is $\theta_b = 40.9^\circ$.
 (c) It is impossible, $\sin \theta < \tan \theta$ for any θ between 0° and 90° .

Solution P5.4

- (a) For E layer, $f_p = 2.84 \text{ MHz}$.
 For F layer, $f_p = 6.95 \text{ MHz}$.
 (b) In E layer, $\theta_t = \sin^{-1} [1.04 \sin \theta]$.
 In F layer, $\theta_t = \sin^{-1} [1.39 \sin \theta]$.
 (c) For E layer total reflection happens when $f < \frac{2}{\sqrt{3}} f_p = 3.27 \text{ MHz}$.
 For F layer total reflection happens when $f < \frac{2}{\sqrt{3}} f_p = 8.03 \text{ MHz}$.
