# Lecture 7.

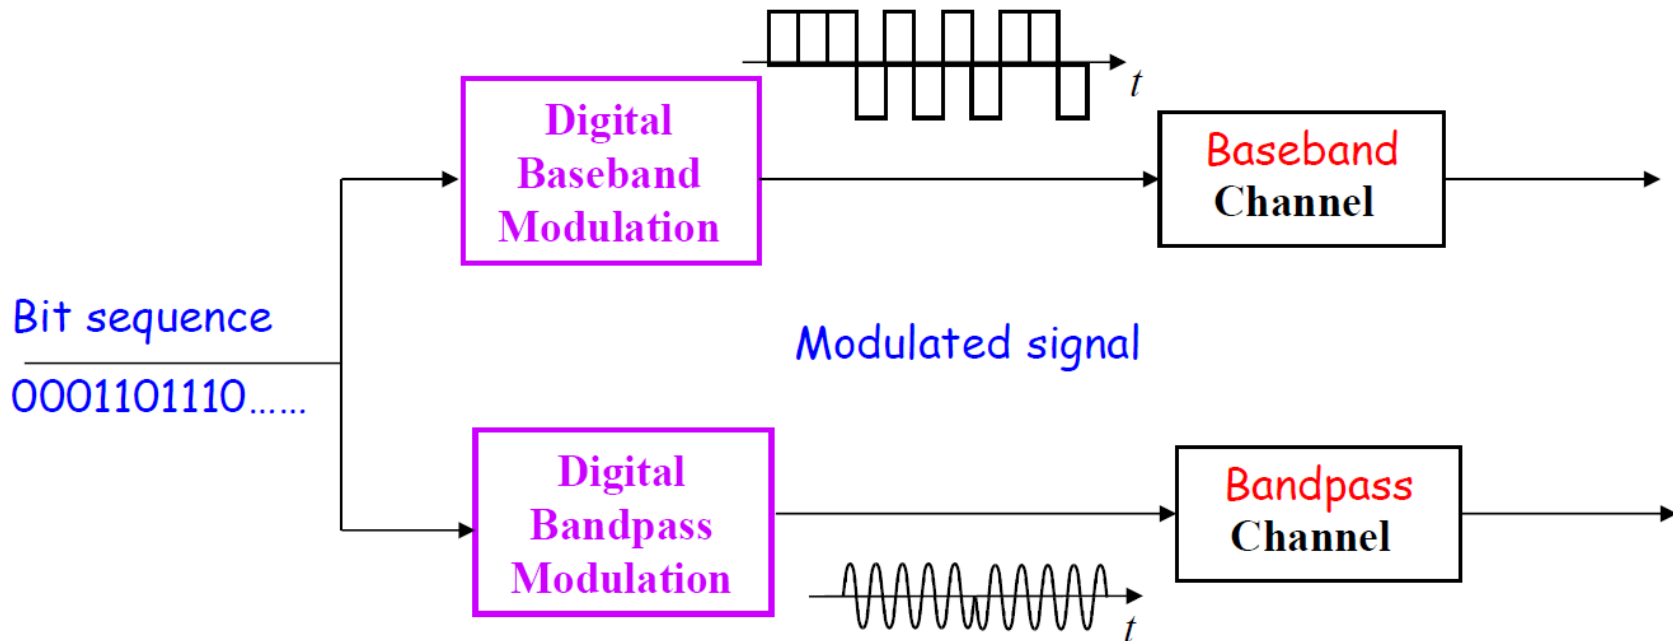

# Digital Modulation

Prof. An Liu  
College of ISEE, Zhejiang University

# Digital Communications

# Digital Modulation

- How to choose proper digital waveforms to "carry" the digits?

# Digital Modulation

- Bit Rate: number of bits transmitted in unit time
- Required channel bandwidth: determined by the bandwidth of the modulated signal.
- Bandwidth Efficiency:

$$\gamma \triangleq \frac{\text{Information Bit Rate } R_b}{\text{Required Channel Bandwidth } B_h}$$

---

# Digital Baseband Modulation

# Digital Baseband Modulation

- Choose **baseband** signals to carry the digits.
  - Each baseband signal can carry multiple bits.

Binary

- Each baseband signal carries 1 bit.

- Bit Rate:  $R_b = 1 / \tau$

- Totally 2 baseband signals are required.

M-ary

- Each baseband signal carries a symbol (with  $\log_2 M$  bits).

- Symbol Rate:  $R_s = 1 / \tau$       Bit Rate:  $R_b = (\log_2 M) / \tau$

- Totally  $M$  baseband signals are required.

# Digital Baseband Modulation

- Focus on “amplitude modulation”
  - The baseband signals have the same shape, but different amplitudes.
  - Time-domain representation of the modulated signal:

$$s(t) = \sum_{n=-\infty}^{\infty} Z_n \cdot v(t - n\tau)$$

where  $Z_n$  is a discrete random variable with  $\Pr\{Z_n = a_i\} = 1/M$ ,  $i = 1, \dots, M$ ,  
 $v(t)$  is a unit baseband signal.

- Power spectrum of the modulated signal:

$$G_s(f) = \frac{1}{\tau} |V(f)|^2 \cdot \left( \sigma_Z^2 + \frac{\mu_Z^2}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right) \right)$$

Read the  
supplemental  
material for  
details.

# Pulse Amplitude Modulation (PAM)

# Binary PAM

1: a positive rectangular pulse  
with amplitude  $A$  and width  $\tau$

0: a negative rectangular pulse  
with amplitude  $-A$  and width  $\tau$

$$s(t) = \sum_{n=-\infty}^{\infty} Z_n \cdot v(t - n\tau)$$

$$\checkmark \quad \Pr\{Z_n = \pm 1\} = 1/2$$

$$\checkmark \quad v(t) = \begin{cases} A, & 0 \leq t \leq \tau \\ 0, & \text{otherwise} \end{cases}$$

# Power Spectrum of Binary PAM

$$G_s(f) = \frac{1}{\tau} |V(f)|^2 \cdot \left( \sigma_z^2 + \frac{\mu_z^2}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right) \right)$$

With Binary PAM:  $V(f) = A\tau \text{sinc}(f\tau)$

$$\mu_z = 0, \quad \sigma_z^2 = 1$$

$$G_{BPAM}(f) = A^2 \tau \text{sinc}^2(f\tau)$$

See Textbook (Sec. 3.2) or Reference [Proakis & Salehi] (Sec. 8.2) for more details.

# Effective Bandwidth of Binary PAM

- Suppose 90% of signal power must pass through the channel (90% in-band power):

$$\left. \begin{array}{l} \text{Required Channel Bandwidth: } B_{h\_90\%} = 1/\tau \\ \text{Bit rate: } R_b = 1/\tau \end{array} \right\} B_{h\_90\%} = R_b$$

- Suppose 95% of signal power must pass through the channel (95% in-band power):

$$\text{Required Channel Bandwidth: } B_{h\_95\%} = 2/\tau = 2R_b$$

# Bandwidth Efficiency of Binary PAM

- Bandwidth Efficiency :  $\gamma = \frac{\text{Information Bit Rate } R_b}{\text{Required Channel Bandwidth } B_h}$
- Bandwidth Efficiency of Binary PAM:

$$R_b = 1 / \tau$$

$$B_{h\_90\%} = 1 / \tau$$

$$B_{h\_95\%} = 2 / \tau$$

$$\gamma_{BPAM} = 1 \quad \text{with 90\% in-band power}$$

$$\gamma_{BPAM} = 0.5 \quad \text{with 95\% in-band power}$$

What if the two pulses have unsymmetrical amplitudes?

# Binary On-Off Keying (OOK)

1: a positive rectangular pulse with amplitude  $A$  and width  $\tau$

0: nothing (can be regarded as a pulse with amplitude 0)

$$s(t) = \sum_{n=-\infty}^{\infty} Z_n \cdot v(t - n\tau)$$

$$\checkmark \quad \Pr\{Z_n = 1\} = \Pr\{Z_n = 0\} = 1/2$$

$$\checkmark \quad v(t) = \begin{cases} A, & 0 \leq t \leq \tau \\ 0, & \text{otherwise} \end{cases}$$

# Power Spectrum of Binary OOK

$$G_s(f) = \frac{1}{\tau} |V(f)|^2 \cdot \left( \sigma_Z^2 + \frac{\mu_Z^2}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right) \right)$$

With Binary OOK:  $V(f) = A\tau \text{sinc}(f\tau)$

$$\mu_Z = 1/2, \quad \sigma_Z^2 = 1/4$$

$$G_{BOOK}(f) = \frac{1}{\tau} (A\tau \text{sinc}(f\tau))^2 \cdot \left( \frac{1}{4} + \frac{1}{4\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right) \right)$$

# Bandwidth Efficiency of Binary OOK

- Bandwidth Efficiency :  $\gamma = \frac{\text{Information Bit Rate } R_b}{\text{Required Channel Bandwidth } B_h}$
- Bandwidth Efficiency of Binary OOK:

$$R_b = 1/\tau$$

$$B_{h\_90\%} = 1/\tau$$

$$B_{h\_95\%} = 2/\tau$$

$$\gamma_{OOK} = 1 \quad \text{with 90\% in-band power}$$

$$\gamma_{OOK} = 0.5 \quad \text{with 95\% in-band power}$$

Can we improve the bandwidth efficiency without sacrificing the in-band power?

# 4-ary PAM

- 4-ary PAM: Each waveform carries 2-bit information.

$$s(t) = \sum_{n=-\infty}^{\infty} Z_n \cdot v(t - n\tau)$$

$$\begin{aligned} \checkmark \quad \Pr\{Z_n = 1\} &= \Pr\{Z_n = 1/3\} \\ &= \Pr\{Z_n = -1\} = \Pr\{Z_n = -1/3\} \\ &= 1/4 \end{aligned}$$

$$\checkmark \quad v(t) = \begin{cases} A, & 0 \leq t \leq \tau \\ 0, & \text{otherwise} \end{cases}$$

# Power Spectrum of 4-ary PAM

$$G_s(f) = \frac{1}{\tau} |V(f)|^2 \cdot \left( \sigma_z^2 + \frac{\mu_z^2}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right) \right)$$

With 4-ary PAM:  $V(f) = A\tau \text{sinc}(f\tau)$   
 $\mu_z = 0, \sigma_z^2 = 5/9$

$G_{4PAM}(f) = \frac{5}{9} A^2 \tau \text{sinc}^2(f\tau)$

- Required channel bandwidth with 90% in-band power:  $B_{h\_90\%} = 1/\tau$
- Required channel bandwidth with 95% in-band power:  $B_{h\_95\%} = 2/\tau$

# Bandwidth Efficiency of 4-ary PAM

- Symbol rate:  $R_s = 1/\tau$
- Bit rate:  $R_b = 2 \cdot R_s = 2/\tau$
- Require channel bandwidth:

with 90% in-band power:  $B_{h\_90\%} = 1/\tau = R_s = \frac{1}{2} R_b$

with 95% in-band power:  $B_{h\_95\%} = 2/\tau = 2R_s = R_b$

$\gamma_{4PAM} = 2$  with 90% in-band power

$\gamma_{4PAM} = 1$  with 95% in-band power

4-ary PAM achieves higher bandwidth efficiency than binary PAM!

# Bandwidth Efficiency of M-ary PAM

- Suppose there are totally  $M$  distinct amplitude (power) levels.
- How many bits are carried by each symbol?

$$M = 2^k \Rightarrow k = \log_2 M$$

- What is the relationship between symbol rate  $R_S$  and bit rate  $R_b$ ?

$$R_S = R_b / k \quad \text{or} \quad R_b = kR_S$$

- What is the required channel bandwidth with 90% in-band power?

$$B_{h\_90\%} = R_S = R_b / k$$

- Bandwidth Efficiency of M-ary PAM

Tradeoff between bandwidth efficiency and fidelity performance

$$\mathcal{V}_{MPAM} = k = \log_2 M \quad \text{with 90\% in-band power}$$

- A larger  $M$  also leads to a smaller minimal amplitude difference – higher error probability (to be discussed).

# Pulse Shaping

# Transmission over Bandlimited Channel

- Frequency domain

- Time domain

Sample  $y(t)$  at  $m\tau, m=1,2,\dots$ , we have

$$y(m\tau) = \sum_{n=-\infty}^{\infty} Z_n \cdot x(m\tau - n\tau) = Z_m \cdot x(0) + \sum_{n \neq m} Z_n \cdot x(m\tau - n\tau)$$

Inter-symbol Interference (ISI)!

# ISI and Eye Diagram

- An eye diagram is constructed by plotting overlapping k-symbol segments of a baseband signal.
- An eye diagram can be displayed on an oscilloscope by triggering the time sweep of the oscilloscope.

See Reference [Ziemer & Tranter] (Sec. 4.6) for more details about eye diagram.

- ISI is caused by insufficient channel bandwidth.
- Any better choice than rectangular pulse?

Sinc-Shaped pulse

# Sinc-Shaped Pulse

Rectangular Pulse

Sinc-Shaped Pulse

# Binary Sinc-Shaped-Pulse Modulated Signal

1: a positive sinc-shaped pulse with amplitude  $A$  and first crossing-zero point  $\pm\tau$

0: a negative sinc-shaped pulse with amplitude  $-A$  and first crossing-zero point  $\pm\tau$

$$s(t) = \sum_{n=-\infty}^{\infty} Z_n \cdot v(t - n\tau)$$

$$\checkmark \quad \Pr\{Z_n = \pm 1\} = 1/2$$

$$\checkmark \quad v(t) = A \operatorname{sinc}(t / \tau)$$

# Power Spectrum of Sinc-Shaped-Pulse Modulated Signal

$$G_s(f) = \frac{1}{\tau} |V(f)|^2 \cdot \left( \sigma_z^2 + \frac{\mu_z^2}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right) \right)$$

With Binary Sinc-Shaped-Pulse Modulated Signal:  $\mu_z = 0, \sigma_z^2 = 1$   
 $V(f) = A\tau, |f| \leq \frac{1}{2\tau}$

$$G_{BSSP}(f) = A^2\tau, |f| \leq \frac{1}{2\tau}$$

Bit Rate:  $R_b = 1/\tau$

Required channel bandwidth:  $B_h = 1/(2\tau) = R_b / 2$

$\gamma_{BSSP} = 2$   
 (with 100% in-band power)

# Sinc-Shaped-Pulse Modulated Signal over Bandlimited Channel

- Frequency domain

- Time domain

Are there any other (better) choices to achieve zero ISI?

# Nyquist Pulse-Shaping Criterion for Zero ISI

## Nyquist pulse-shaping criterion for zero ISI

A necessary and sufficient condition for pulse  $v(t)$  to satisfy

$$v(n\tau) = \begin{cases} 1, & n = 0 \\ 0, & n \neq 0 \end{cases}$$

is that its Fourier transform  $V(f)$  satisfies  $\sum_{m=-\infty}^{\infty} V(f + \frac{m}{\tau}) = \tau$ .

Suppose that the bandwidth of unit pulse  $v(t)$  is  $W$ , which is also the required channel bandwidth. To pass the digital modulated signal with symbol rate  $1/\tau$  through the channel:

- If  $1/\tau - W > W$ , there is no way to satisfy the Nyquist pulse-shaping criterion for zero ISI.

# Nyquist Pulse-Shaping Criterion for Zero ISI

According to Nyquist pulse-shaping criterion for zero ISI:

- ✓ If the symbol rate  $1/\tau > 2W$ , there is no way that we can design a system with zero ISI.
- ✓ If the symbol rate  $1/\tau = 2W$ , we must have 
$$V(f) = \begin{cases} \tau, & |f| < W \\ 0, & \text{otherwise} \end{cases}$$
  - The maximum symbol rate for zero ISI is  $2W$ .
  - In the binary case, the highest bandwidth efficiency for zero-ISI is 2, which is achieved by the binary sinc-shaped-pulse modulated signal.
- ✓ If the symbol rate  $1/\tau < 2W$ , we have numerous choices. One of them is called **Raised-Cosine Pulse**.

See Textbook (Sec. 4.4) for more details.

# Raised-Cosine Pulse: Tradeoff between Bandwidth Efficiency and Robustness

Sinc-Shaped Pulse:

- Strong ISI at  $t \neq n\tau$ .
- Perfect synchronization is required at the receiver side.

Raised-Cosine Pulse:  $v(t) = A \text{sinc}(t/\tau) \left[ \frac{\cos(2\pi\beta t)}{1 - (4\beta t)^2} \right]$

- Larger  $\beta$   $\rightarrow$  More robust  
 $\rightarrow$  Larger bandwidth

# Summary I: Digital Baseband Modulation

		Complexity	Bandwidth Efficiency
PAM	Binary PAM	Low	1 (90% in-band power)
	4-ary PAM	Low	2 (90% in-band power)
Binary Sinc-Shaped-Pulse Modulation		High (Susceptible to timing jitter)	2 (100% in-band power)
Binary Raised-Cosine-Pulse Modulation		Moderate	$1 < \frac{R_b}{\frac{1}{2}R_b + \beta} < 2$ (100% in-band power)

# Digital Bandpass Modulation

# Digital Bandpass Modulation

- How to transmit a baseband signal over a bandpass channel?

# Binary Amplitude Shift Keying (ASK)

- Generate a binary ASK signal:
  - Send the carrier signal if the information bit is “1”;
  - Send 0 volts if the information bit is “0”.

$$s_{BASK}(t) = s_{BOOK}(t) \cos(2\pi f_c t)$$

Binary On-Off Keying  $s_{BOOK}(t)$

X

$$\cos(2\pi f_c t)$$

# Power Spectrum of BASK

- Power spectrum of Binary OOK:

$$G_{BOOK}(f) = \frac{1}{\tau} (A\tau \text{sinc}(f\tau))^2 \cdot \left( \frac{1}{4} + \frac{1}{4\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right) \right)$$

- Power spectrum of Binary ASK:

$$G_{BASK}(f) = \frac{1}{4} [G_{BOOK}(f - f_c) + G_{BOOK}(f + f_c)]$$

Read the supplemental material for details.

# Bandwidth Efficiency of BASK

The bandwidth of BASK signal is twice of that of its baseband signal (binary On-Off Keying)!

- The required channel bandwidth for 90% in-band power:

$$B_{h\_90\%} = 2R_b$$

- Bandwidth Efficiency of BASK:

$$\gamma_{BASK} = 0.5 \text{ with 90\% in-band power}$$

$$\gamma_{BASK} = 0.25 \text{ with 95\% in-band power}$$

# Binary Frequency Shift Keying (BFSK)

- Generate a binary FSK signal:
  - Send the signal  $A\cos(2\pi(f_c + \Delta f)t)$  if the information bit is “1”;
  - Send the signal  $A\cos(2\pi(f_c - \Delta f)t)$  if the information bit is “0”.

$$s_{BFSK}(t) = \underbrace{s_{b1,BFSK}(t)}_{\downarrow} \cos(2\pi(f_c + \Delta f)t) + \underbrace{s_{b2,BFSK}(t)}_{\downarrow} \cos(2\pi(f_c - \Delta f)t)$$

$$s_{b1,BFSK}(t) = \begin{cases} A & b_i = 1 \\ 0 & b_i = 0 \end{cases}$$

Binary On-Off Keying

$$s_{b2,BFSK}(t) = \begin{cases} 0 & b_i = 1 \\ A & b_i = 0 \end{cases}$$

Binary On-Off Keying

# Bandwidth Efficiency of BFSK

$$G_{BFSK}(f) = \frac{1}{4}[G_{b1,BFSK}(f - (f_c + \Delta f)) + G_{b1,BFSK}(f + (f_c + \Delta f))] \\ + \frac{1}{4}[G_{b2,BFSK}(f - (f_c - \Delta f)) + G_{b2,BFSK}(f + (f_c - \Delta f))]$$

- The required channel bandwidth for 90% in-band power:

$$B_{h_{90\%}} = 2\Delta f + 2R_b$$

- Bandwidth efficiency of BFSK:  
(with 90% in-band power)  $\gamma_{BFSK} = 0.5 \cdot \frac{1}{1 + \Delta f / R_b} < 0.5 = \gamma_{BASK}$

The bandwidth efficiency of BFSK signal is lower than that of BASK signal!

# Binary Phase Shift Keying (BPSK)

- Generate a binary PSK signal:
  - Send the signal  $A\cos(2\pi f_c t)$  if the information bit is “1”;
  - Send the signal  $A\cos(2\pi f_c t + \pi)$  if the information bit is “0”.  
 $= -A\cos(2\pi f_c t)$

$$s_{BPSK}(t) = s_{BPAM}(t) \cos(2\pi f_c t)$$

Binary PAM  $s_{BPAM}(t)$

X

$\cos(2\pi f_c t)$

# Bandwidth Efficiency of BPSK

$$G_{BPSK}(f) = \frac{1}{4}[G_{BPAM}(f - f_c) + G_{BPAM}(f + f_c)]$$

- The required channel bandwidth for 90% in-band power:

$$B_{h\_90\%} = 2R_b$$

- Bandwidth Efficiency of BPSK:

$$\gamma_{BPSK} = 0.5 \text{ with 90\% in-band power}$$

$$\gamma_{BPSK} = 0.25 \text{ with 95\% in-band power}$$

The bandwidth efficiency of BPSK signal is the same as that of BASK signal!

# M-ary PSK

- M-ary PSK: transmitting pulses with  $M$  possible different carrier phases, and allowing each pulse to represent  $\log_2 M$  bits.

✓ Binary PSK:

“1”  $s_1(t) = A \cos(2\pi f_c t)$

“0”  $s_2(t) = A \cos(2\pi f_c t + \pi)$

✓ Quaternary PSK:  
(QPSK)

“11”  $s_1(t) = A \cos(2\pi f_c t + (-\pi / 4))$

“10”  $s_2(t) = A \cos(2\pi f_c t + \pi / 4)$

“00”  $s_3(t) = A \cos(2\pi f_c t + 3\pi / 4)$

“01”  $s_4(t) = A \cos(2\pi f_c t + 5\pi / 4)$

# QPSK

“1 1”  $s_1(t) = A \cos(2\pi f_c t - \pi / 4) = +\frac{A}{\sqrt{2}} \cos(2\pi f_c t) + \frac{A}{\sqrt{2}} \sin(2\pi f_c t)$

“1 0”  $s_2(t) = A \cos(2\pi f_c t + \pi / 4) = +\frac{A}{\sqrt{2}} \cos(2\pi f_c t) - \frac{A}{\sqrt{2}} \sin(2\pi f_c t)$

“0 0”  $s_3(t) = A \cos(2\pi f_c t + 3\pi / 4) = -\frac{A}{\sqrt{2}} \cos(2\pi f_c t) - \frac{A}{\sqrt{2}} \sin(2\pi f_c t)$

“0 1”  $s_4(t) = A \cos(2\pi f_c t + 5\pi / 4) = -\frac{A}{\sqrt{2}} \cos(2\pi f_c t) + \frac{A}{\sqrt{2}} \sin(2\pi f_c t)$

A QPSK signal can be decomposed into the sum of two PSK signals:  
an in-phase component and a quadrature component.

$$s_{QPSK}(t) = d_I \frac{A}{\sqrt{2}} \cos(2\pi f_c t) + d_Q \frac{A}{\sqrt{2}} \sin(2\pi f_c t)$$

Two arrows originate from the terms  $d_I \frac{A}{\sqrt{2}} \cos(2\pi f_c t)$  and  $d_Q \frac{A}{\sqrt{2}} \sin(2\pi f_c t)$  in the equation above, pointing downwards to the definitions of  $d_I$  and  $d_Q$  respectively.

$$d_I = \begin{cases} 1 & \text{if } b_{2i-1} = 1 \\ -1 & \text{if } b_{2i-1} = 0 \end{cases} \quad d_Q = \begin{cases} 1 & \text{if } b_{2i} = 1 \\ -1 & \text{if } b_{2i} = 0 \end{cases}$$

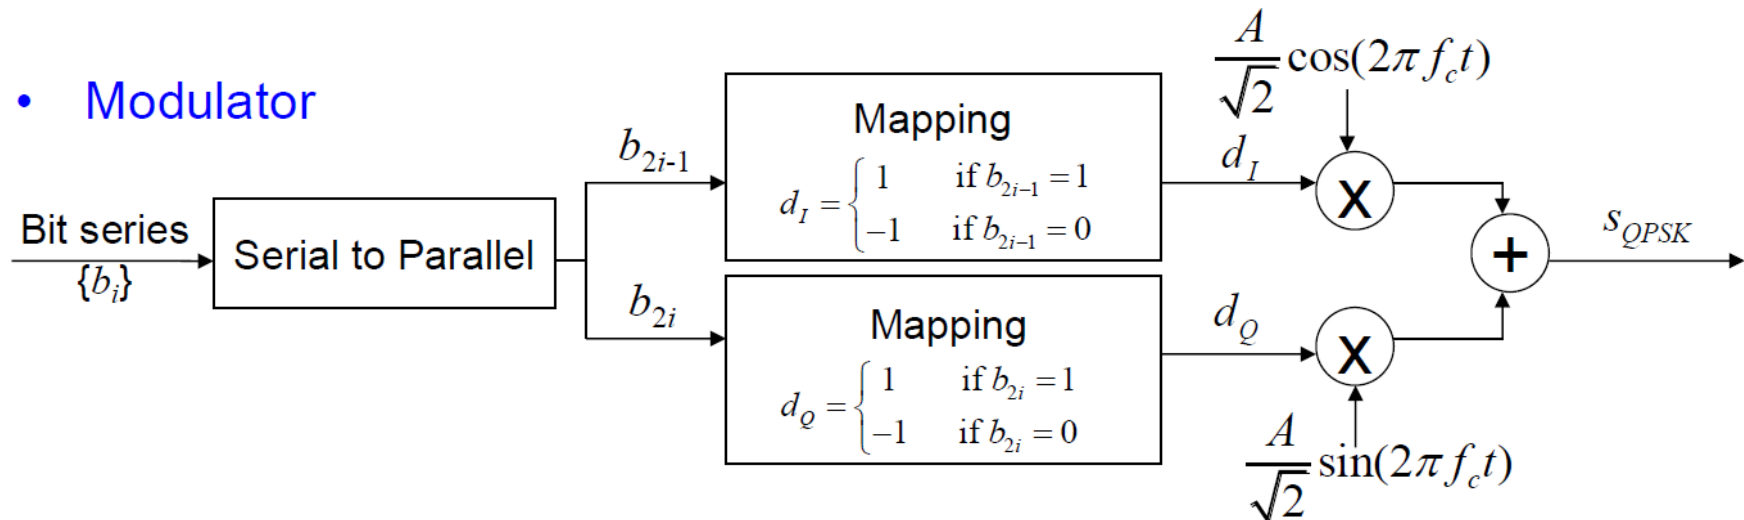

# QPSK Modulator

$$s_{QPSK}(t) = d_I \frac{A}{\sqrt{2}} \cos(2\pi f_c t) + d_Q \frac{A}{\sqrt{2}} \sin(2\pi f_c t)$$

$$d_I = \begin{cases} 1 & \text{if } b_{2i-1} = 1 \\ -1 & \text{if } b_{2i-1} = 0 \end{cases}$$

$$d_Q = \begin{cases} 1 & \text{if } b_{2i} = 1 \\ -1 & \text{if } b_{2i} = 0 \end{cases}$$

- Modulator

# Bandwidth Efficiency of QPSK

- Symbol rate:  $R_{S,QPSK} = 1/\tau$
- Bit rate:  $R_{b,QPSK} = 2R_{S,QPSK} = 2/\tau$
- Required Channel Bandwidth:
  - $B_{h\_90\%} = 2R_{S,QPSK} = R_{b,QPSK}$
  - $B_{h\_95\%} = 4R_{S,QPSK} = 2R_{b,QPSK}$
- Bandwidth Efficiency:
 

$\gamma_{QPSK} = 1$  with 90% in-band power  
 $\gamma_{QPSK} = 0.5$  with 95% in-band power

QPSK achieves higher bandwidth efficiency than BPSK!
