数字信号处理

2017年秋冬学期

第十三讲 2018年1月8日

7 多抽样率数字信号处理

7.4 以有理因子I/D转换抽样频率

例 7.2 设信号 x(n)的抽样频率为 $f_s=12$ kHz、分别按如下两种情况对其进行抽样率转换, $f_y=26$ kHz,(2)抽样频率转换为 $f_y=10$ kHz。

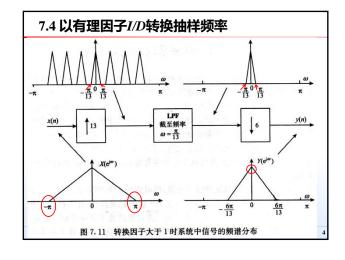

(1) 有理因子 $\frac{f_x}{f_x} = \frac{26}{12} = \frac{13}{6} = \frac{I}{D}$ 大于1,无信息损失

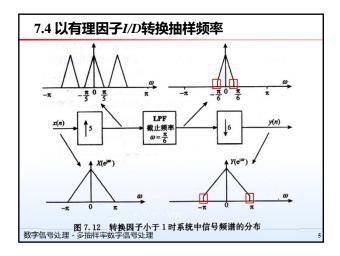

低通滤波器通 $\min\left(\frac{\pi}{I}, \frac{\pi}{D}\right) = \frac{\pi}{I} = \frac{\pi}{13}$

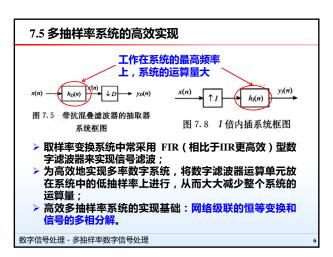

(2) 有理因子 $\frac{f_y}{f_x} = \frac{10}{12} = \frac{5}{6} = \frac{I}{D}$ 小于1,有信息损失

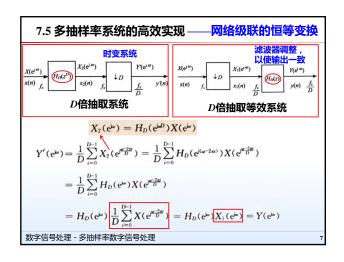

低通滤波器通 $\min\left(\frac{\pi}{I}, \frac{\pi}{D}\right) = \frac{\pi}{D} = \frac{\pi}{6}$
